

# Trend Vision One™ - Endpoint Security

## Optimized prevention, detection, and response for endpoints, servers, and cloud workloads

Trend Vision One™ - Endpoint Security is the leading endpoint security solution that is purpose-built for endpoints, servers, and cloud workloads, integrating advanced threat protection, EDR/XDR, and threat intelligence. With this solution, you can streamline IT/security operations, reduce complexity, and achieve optimal security outcomes across your on-premises, cloud, multi-cloud, and hybrid environments.

As part of Trend Vision One™, a modern, cloud-native cybersecurity platform with the broadest set of native solutions, complimented with third-party integration, you can connect endpoint and workload security with other protection products, threat intel, SIEM, orchestration, build pipeline, attack surface management, and more. Trend Vision One supports diverse hybrid IT environments, helps in automating and orchestrating workflows, and delivers expert cybersecurity services, so you can stop adversaries faster and take control of your cyber risks.

## Integrated EDR

With Trend Vision One, your customers get the XDR advantage with integrated EDR capabilities.

- Receive prioritized, actionable alerts and comprehensive incident views.
- Investigate root cause and execution profile across Linux and Microsoft Windows system attacks to uncover their scope and initiate direct response.
- Hunt for threats via multiple methods—from powerful queries to simple text search—to proactively pinpoint tactics or techniques and validate suspicious activity in your environment.
- Continuously search for newly discovered IoCs via Trend Micro's automated intelligence or custom intelligence sweeping.

## Streamlined workflow for IT and security operations

Trend Vision One protects user endpoints, servers, and cloud workloads using a single solution with centralized visibility, management, licensing, and role-based access control with automated protection from a single pane of glass, using the Trend Vision One product console to manage endpoint inventory, detections, mitigation actions, and policies.

## Protection Points

- Physical endpoints
- Microsoft® Windows® PCs and servers
- Mac computers
- Point of sale (POS) and ATM endpoints
- Server
- Cloud workload
- Virtual machines

## Threat detection capabilities

- High-fidelity machine learning (pre-execution and runtime)
- Behavioral analysis (against scripts, injection, ransomware, memory, and browser attacks)
- In-memory analysis for identification of fileless malware
- Variant protection
- Census check
- Web reputation
- Exploit prevention (host firewall, exploit protection)
- Command and control (C&C) blocking
- Data loss prevention (DLP)
- Device and application control
- Ransomware rollback
- Sandbox and breach detection integration
- Extended detection and response (XDR)

## Endpoint Security

Get timely protection against an ever-growing variety of threats by leveraging automated and advanced security controls and the latest industry-leading threat intelligence.

With a full range of layered prevention, detection and response capabilities—such as modern anti-malware and ransomware protection, device control, host-based intrusion prevention, application control, machine learning/AI, and more—you can defend your endpoints, virtual desktops, servers, and cloud workloads in real-time.

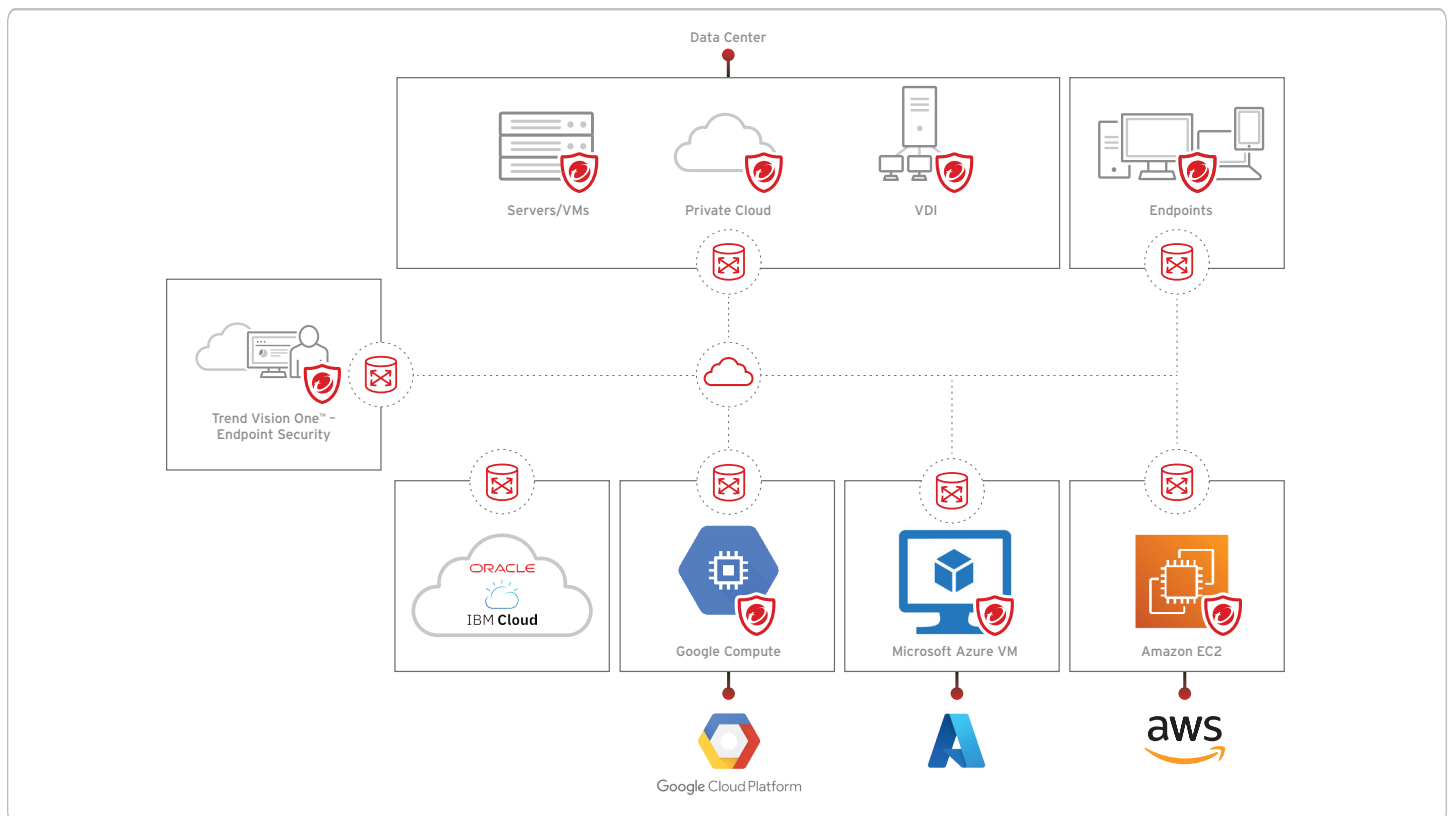

## Purpose-built for server and cloud Workload Security

According to Gartner, “An end-user endpoint is regularly exposed to threats through email, websites, cloud services or USB drives. By contrast, threat actors target server workloads using software and configuration vulnerabilities, lateral movement, and stolen employee credentials. These differences in threat exposure create a need for distinct security requirements and protection strategies for end-user endpoints and server workloads”.

<sup>1</sup>Gartner, Prioritizing Security Controls for Enterprise Servers and End-User Endpoints (Evgeny Mirolyubov, Peter Firstbrook, January 2023)

Ensure your security addresses the way server and cloud workloads are deployed and attacked with Trend Vision One - Endpoint Security. Protect against vulnerabilities, malware, and unauthorized changes, and deploy advanced security capabilities specifically designed for the server and cloud workload environment.

This includes Intrusion Prevention System (IPS) for server applications, integrity monitoring, log inspection, and container protection. Seamlessly secure dynamic applications in the cloud, with automated discovery of workloads across cloud providers, such as AWS, Microsoft Azure, and Google Cloud Platform™.

## Key advantages

### Advanced threat protection

- Advanced security controls such as an intrusion prevention system (IPS), integrity monitoring, machine learning, and application control detect and block threats and unauthorized software execution in real time.
- Shield from known and newly discovered vulnerabilities with patches delivered through an IPS, ensuring systems stay protected from existing and future threats before vendor patch is released.
- Send alerts and trigger proactive prevention upon the detection of suspicious or malicious activity.
- Track website credibility and protect users from infected sites with web reputation threat intelligence from Trend's global domain-reputation database.
- Identify and block botnet and targeted attack C&C communications.

### Modern, cloud native security for the hybrid cloud

- Workloads, by default, are vulnerable from the moment they are instantiated. Trend provides built-in workload discovery capabilities, integrating with AWS, Microsoft Azure, Google Cloud Platform, VMware, and Microsoft Active Directory to provide protections from the moment they are created.
- Eliminate the cost of deploying multiple point solutions and achieve consistent security across physical, virtualized, cloud, container, and user endpoint environments with a single management console.
- Monitor for changes and attacks on Docker and Kubernetes platforms with integrity monitoring and log inspection capabilities.
- Protect runtime containers through container vulnerability shielding (via IPS), real-time malware protection, and east-west container traffic inspection.

### Tailored protection for your server and cloud workload

#### Intrusion and vulnerability prevention for endpoints, servers, and their applications:

The intrusion prevention module protects your environment from known and zero-day vulnerability attacks as well as against SQL injections attacks, cross-site scripting attacks, and other web application vulnerabilities.

Our vulnerability protection and intrusion prevention allow us to provide virtual patches to shield from known vulnerabilities until a patch is available from the vendor. This is backed by our world-leading bug bounty, the Zero Day Initiative.

#### File integrity monitoring

The integrity monitoring module scans for unexpected changes to registry values, registry keys, services, processes, installed software, ports and files. Using a baseline secure state as a reference, the integrity monitoring module performs scans on the above and logs an event (and an optional alert) if it detects any unexpected changes.

#### Achieve cost-effective compliance

- Address major compliance requirements for the GDPR, HIPAA, NIST, and more, with one integrated and cost-effective solution.
- Provide detailed audit reports that document prevented attacks and compliance policy status.
- Reduce the preparation time and effort required to support audits.

### Protecting your Linux platform

Trend's platform provides support for extensive Linux builds and hundreds of Linux kernels, Solaris™, AIX®, and HP-UX®.

#### Log inspection

The log inspection protection module helps you identify important events that might be buried in your operating system and application logs.

The log inspection module allows you to:

- Detect suspicious behavior
- Collect events across heterogeneous environments containing different operating systems and diverse applications
- View events such as error and informational events (disk full, service start, service shutdown, etc.)
- Create and maintain audit trails of administrator activity (administrator login or logout, account lockout, policy change, etc.)

The log inspection feature in Trend Vision One – Endpoint Security enables real-time analysis of third-party log files. The log inspection rules and decoders provide a framework to parse, analyze, rank and correlate events across a wide variety of systems.

## Trend Vision One - Endpoint Security offerings

	Core	Essentials	Pro
Primary endpoint type	User endpoints and basic servers	User endpoints and basic servers	Critical endpoints including servers and workloads
Windows, Linux and Mac OS	●	●	●

### With Trend Vision One you can have it all

- **Malware and ransomware protection:** Defends endpoints against threats like malware, ransomware, and malicious scripts. Advanced protection capabilities adapt to protect against unknown and stealthy new threats.
- **Extensive detection and response capabilities in one console:** XDR goes beyond EDR with cross-layer detection and threat hunting and investigation across email, endpoints, servers, cloud workloads, and networks.
- **The industry's most timely virtual patching:** Vulnerability protection applies virtual patches for protection before a patch is available or deployable.
- **Ransomware rollback:** Detects ransomware with runtime machine learning and expert rules to block encryption processes in milliseconds. Rollback restores any files encrypted before the detection.
- **Advanced generative AI with Trend Companion** for analysts to search and make sense of complex threat activity.
- **Trend Micro™ Zero Trust Risk Insights** measures risk from vulnerabilities, misconfigurations, asset criticality, XDR, anomalies, and cloud activity.
- **Trend Vision One** delivers the broadest native XDR sensor coverage in the cybersecurity market. The platform's native-first, hybrid approach to XDR and attack surface management (ASM) benefits security teams by delivering richer activity telemetry— not just detection data—across security layers with full context and understanding. This results in earlier, more precise risk and threat detection and more efficient investigation.

## Maximize protection with smart, layered security

Trend Vision One - Endpoint Security protects your organization with a layered combination of threat protection techniques to deliver the best protection against the broadest range of threats with the most efficient performance.

All the information from each layer feeds into Trend Vision One XDR to dramatically improve your ability to investigate, detect, and respond to threats across the environment.

### Protection Layer 1

- Signature-based techniques accurately filter out all known bad data and allow known good data to pass through.

### Protection Layer 2

- Predictive machine learning, application control, and variant protection analyzes and blocks unknown data before it has a chance to execute.

### Protection Layer 3

- Separate run-time machine learning models monitor any program, script, document or otherwise that is executing and detects threats and suspicious behavior.

Cloud sandboxing is a secure virtual environment that manages and analyzes objects submitted by integrated products and users. It provides an additional layer of protection against unknown threats that are endpoint operating system-focused.

Trend Vision One applies the most effective AI and expert analytics to the activity data collected from native sensors (e.g. EDR) in the environment to produce fewer, higher-fidelity alerts. Global threat intelligence from the Trend Micro™ Smart Protection Network™ combined with expert detection rules continually updated from our threat experts maximize the power of AI and analytical models in unparalleled ways.

### Proven Leadership

- Trend is a leader in Gartner Magic Quadrant for EPP** since 2002. 19 times in a row
- Ranked #1 for Cloud Workload Security Market Share** for the 5th consecutive year (2022)
- A leader in the Forrester New Wave™:** Extended Detection and Response, Q4 2021
- MITRE Engenuity ATT&CK (2022) -** #1 Performer in Linux protection, with 100% of attacks against the Linux host detected and prevented.
